

Coping with uncertainty in human health risk assessment: an inspirative review of methods and attempts

Jiří Kalina

RECETOX, Masaryk University, Kamenice 735/5, 625 00 Brno, Czech republic

Uncertainty analysis is a critical component of human health risk assessment, as it helps to identify and quantify the useful and useless variability associated with different stages of the risk assessment process. There are various ways to cope with the uncertainty in both the data sources and its propagation through following modelling steps. This presentation will guide you through the most common ways of how to handle uncertainty and it will show several examples of their real use.
